Baltic Sea Hydrographic Commission (BSHC)

BALTIC SEA HYDROGRAPHIC COMMISSION

IHO

Home | About | Services | Relations | Working Groups | Meetings | Contact

The Baltic Sea Hydrographic Commission,

which is an integrant part of the International Hydrographic Organisation (IHO), promotes the technical co-operation in the domain of hydrographic surveying, marine cartography and nautical information among the neighboring countries of the Baltic Sea region.

The main objectives of the Commission are the coordination of the production of the Baltic Sea INT Charts, the coordination of hydrographic re-surveys, harmonization of chart datums, harmonization of Baltic Sea ENCs, and the exchange of information and the harmonization of practices with regard to various issues related to hydrography.

The most recent development is the Baltic Sea Bathymetric Database – accessible via this portal.

International Hydrographic Organization
The International Hydrographic Organization is an intergovernmental consultative and technical organization that was established in 1921 to support safety of navigation and the protection of the marine environment. The object of the Organization is to bring about:
- The coordination of the activities of national hydrographic offices
- The greatest possible uniformity in nautical charts and documents
- The adoption of reliable and efficient methods of carrying out and exploiting hydrographic surveys
- The development of the sciences in the field of hydrography and the techniques employed in descriptive oceanography

SJÖFARTSVERKET

Baltic Sea Chart Datum 2000 (BSCD2000)

➢ **Definition:**

The datum refers to each Baltic country´s realization of the European Vertical Reference System (EVRS) with land-uplift epoch 2000, which is connected to the Normaal Amsterdams Peil (NAP).

➢ **Justification:**

The Baltic Sea is an international shallow, non-tidal area in the northern part of Europe with dense traffic. IHO BSHC has approved the name and the adoption of the Baltic Sea Chart Datum 2000 (specification).

➢ **Height systems used as national realization of BSCD2000 (EVRS-based):**

Sweden RH2000	Denmark DVR90	Germany DHHN2016
Poland PL-EVRF2007-NH	Lithuania LAS07	Latvia LAS2000,5
Estonia EH2000	Finland N2000	Norway NN2000

➢ **Chart datum name to be shown in paper charts and water level information:**

Mean Sea Level (Baltic Sea Chart Datum 2000$^{\text{national realization name}}$)
Mean Sea Level (Baltic Sea Chart Datum 2000)
Baltic Sea Chart Datum 2000$^{\text{national realization name}}$
Baltic Sea Chart Datum 2000
BSCD2000 (national realization name)
BSCD2000
National realization name

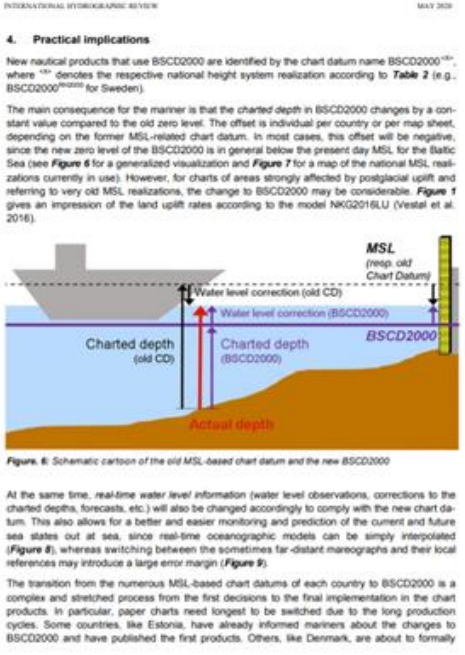
6. DTU Space (Denmark)

Abstract

The *Baltic Sea Chart Datum 2000* (BSCD2000) is a geodetic reference system adopted for Baltic Sea hydrographic surveying, hydrographic engineering, nautical charts, navigational publications and water level information. It is based on the common geodetic standards for the height system (EVRS) and the spatial reference system (ETRS89) in Europe. In particular, the zero level of BSCD2000 is in accordance with the Normaal Amsterdams Peil (NAP). BSCD2000 is about to be adopted as unified chart datum by all the countries around the Baltic Sea. It agrees with most national height realizations used on land. BSCD2000 will facilitate effective use of GNSS methods like GPS, GLONASS and Galileo for accurate navigation and hydrographic surveying in the future.

Résumé

Le *Baltic Sea Chart Datum 2000* (BSCD2000) est un système de référence géodésique adopté pour les levés hydrographiques, l'ingénierie hydrographique, les cartes marines, les publications nautiques et les informations sur le niveau de l'eau de la mer Baltique. Il est basé sur les normes géodésiques communes au Système de Référence Vertical Européen (EVRS) et au Système de Référence Terrestre Européen (ETRS89). En particulier, le zéro hydrographique du BSCD2000 est conforme au *Normaal Amsterdams Peil* (NAP). Le BSCD2000 est sur le point d'être adopté en tant que niveau de référence des cartes commun par l'ensemble des pays bordant la mer Baltique. Il correspond à la plupart des mesures de hauteur nationales utilisées à terre. Le BSCD2000 facilitera l'utilisation efficace des méthodes du GNSS comme le GPS, GLONASS et Galileo pour une navigation et des levés hydrographiques précis à l'avenir.



4. Practical implications

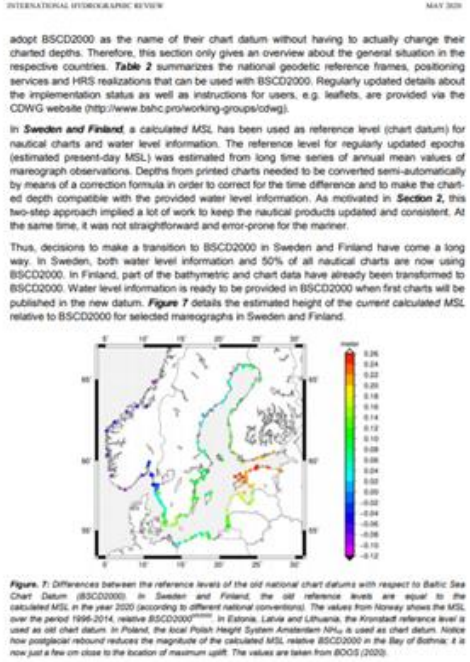
New nautical products that use BSCD2000 are identified by the chart datum name BSCD2000 $^{<5>}$, where $^{<5>}$ denotes the respective national height system realization according to ***Table 2*** (e.g., BSCD2000^{RH2000} for Sweden).

The main consequence for the mariner is that the *charted depth* in BSCD2000 changes by a constant value compared to the old zero level. The offset is individual per country or per map sheet, depending on the former MSL-related chart datum. In most cases, this offset will be negative, since the new zero level of the BSCD2000 is in general below the present day MSL for the Baltic Sea (see ***Figure 6*** for a generalized visualization and ***Figure 7*** for a map of the national MSL realizations currently in use). However, for charts of areas strongly affected by postglacial uplift and referring to very old MSL realizations, the change to BSCD2000 may be considerable. ***Figure 1*** gives an impression of the land uplift rates according to the model NKG2016LU (Vestøl et al. 2016).

Figure. 6: *Schematic cartoon of the old MSL-based chart datum and the new BSCD2000*

At the same time, *real-time water level information* (water level observations, corrections to the charted depths, forecasts, etc.) will also be changed accordingly to comply with the new chart datum. This also allows for a better and easier monitoring and prediction of the current and future sea states out at sea, since real-time oceanographic models can be simply interpolated (***Figure 8***), whereas switching between the sometimes far-distant mareographs and their local references may introduce a large error margin (***Figure 9***).

The transition from the numerous MSL-based chart datums of each country to BSCD2000 is a complex and stretched process from the first decisions to the final implementation in the chart products. In particular, paper charts need longest to be switched due to the long production cycles. Some countries, like Estonia, have already informed mariners about the changes to BSCD2000 and have published the first products. Others, like Denmark, are about to formally



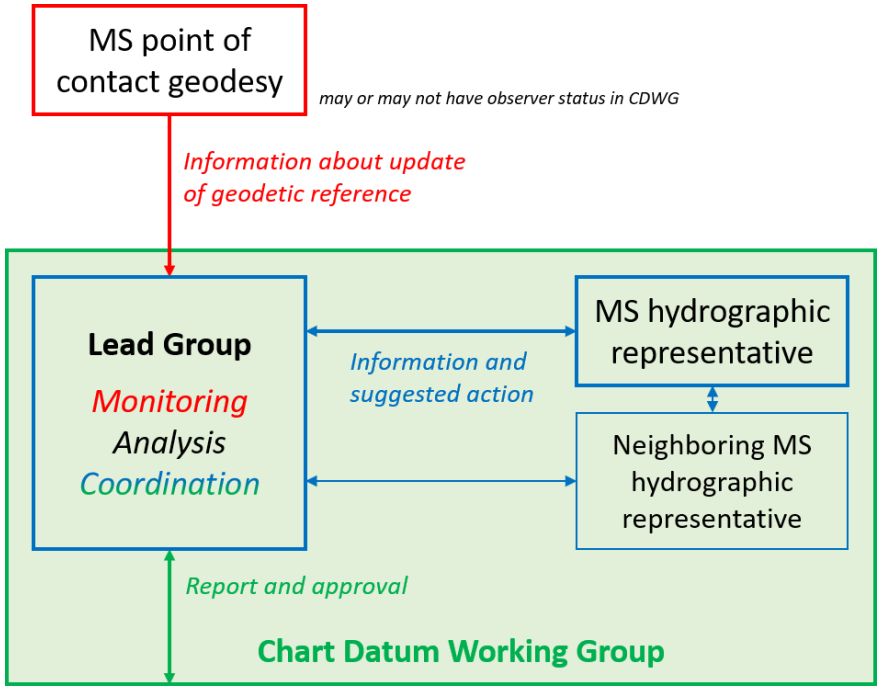
adopt BSCD2000 as the name of their chart datum without having to actually change their charted depths. Therefore, this section only gives an overview about the general situation in the respective countries. ***Table 2*** summarizes the national geodetic reference frames, positioning services and HRS realizations that can be used with BSCD2000. Regularly updated details about the implementation status as well as instructions for users, e.g. leaflets, are provided via the CDWG website (http://www.bshc.pro/working-groups/cdwg).

In ***Sweden and Finland***, a calculated MSL has been used as reference level (chart datum) for nautical charts and water level information. The reference level for regularly updated epochs (estimated present-day MSL) was estimated from long time series of annual mean values of mareograph observations. Depths from printed charts needed to be converted semi-automatically by means of a correction formula in order to correct for the time difference and to make the charted depth compatible with the provided water level information. As motivated in ***Section 2***, this two-step approach implied a lot of work to keep the nautical products updated and consistent. At the same time, it was not straightforward and error-prone for the mariner.

Thus, decisions to make a transition to BSCD2000 in Sweden and Finland have come a long way. In Sweden, both water level information and 50% of all nautical charts are now using BSCD2000. In Finland, part of the bathymetric and chart data have already been transformed to BSCD2000. Water level information is ready to be provided in BSCD2000 when first charts will be published in the new datum. ***Figure 7*** details the estimated height of the *current calculated MSL* relative to BSCD2000 for selected mareographs in Sweden and Finland.

Continuity Management of BSCD2000

Organizational scheme and workflow



BSCD2000 height transformation grid (geoid model)

Release note:
https://doi.org/10.58440/ihr-29-2-n11

Landing page:
https://www.bshc.pro/iho-bscd2000

Digital Object Identifier (DOI) with download

DOI: 10.58440/iho-bscd2000
URL: https://doi.org/10.58440/iho-bscd2000

The DOI has been configured as type 'database'. In perspective, we can assign any number of ”datasets" to a "database". This means that each new BSCD2000 release can have its own entry.

We can also assign literature references (definition, specification, publications etc.) in the future.

Införandestatus 2025

Summary implementation of BSCD2000, S-104 and S-111 status 2025:

Country	Status BSCD2000 for charts	Status BSCD2000 for water level (see mwreg boos)	Status S-104/S-111
Denmark	Chart datum in practice close to EVRS-based chart datum (DVR90). BSCD2000 is implemented in ENC and will be implemented in paper charts In the order of reprinting.	All Danish water level stations are connected to DVR90 (approx. BSCD2000). Data distributed to BOOS/CMEMS in relation to DVR90. Responsibility of Danish Meteorological Institute (DMI), Danish Coastal Authority (Kystdirektoratet) and Danish Environmental Protection Agency (Miljøstyrelsen).	DMI and FCOO (Forsvaret Center for Operativ Oceanografi) is responsible for water level and current information. Have a plan for S-104 and S-111. DGA and DMI coordinates the work.
Estonia	All decisions are taken and the implementation is ongoing. All Berthing and Harbour cells and larger paper scales are in the new height system BSCD2000. Official use in charts and water level information from 2018-01-01. Notices to Mariners 2022-12-01. Info Sheet. Web application Nutimeri displays Estonian Transport Administration's official electronic navigational charts.	All Estonian water level stations are connected to EH2000 (BSCD2000). Data distributed to BOOS/CMEMS in relation to BHS77 (old system). The difference between BHS77 and EH2000 reaches up to 26 cm in the Gulf of Finland. Responsibility of Taltech Marine Systems Institute (MSI) and Estonian Environmental Agency (EEA).	Discussions are ongoing between EMA and MSI. MSI and EEA are responsible for water level and current information. EMA coordinates the work.
Finland	Ongoing. All decisions are taken already in 2008 and 2015. Approach charts from Tornio to Vaasa have been published. The publication status of N2000 charts and Finnish nautical charts portfolio. New video about the N2000 fairway and nautical chart reform.	Water level information provided in both systems, mean sea level (MSL) and N2000 (BSCD2000). The differences between MSL and N2000 is provided as a Table. Water level observations and forecasts will be available in N2000 for the public simultaneously with Traficom nautical charts. Data distributed to BOOS/CMEMS in relation to MSL Responsibility of Finnish Meteorological Institute (FMI).	The first test products of S-104 and S-111 will be created by FMI in the Baltic Sea e-Nav-project until 2026. FMI is responsible for water level and current information. Traficom and FMI coordinates the work.
Germany	EVRS realization in use in practice. The vertical chart datum of BSCD2000 is close to the national height system of Germany (ETRS1989+DHHN2016). All published products will refer to this datum. In August 2021, BSCD2000 was officially introduced as chart datum for German waters in the Baltic Sea. The official introduction was decreed in January 2018 and is binding for all institutions coming under the jurisdiction of the Federal Waterways and Shipping Administration (WSV).	All German water level stations refers to the national height system DHHN2016 (BSCD2000). Data distributed to BOOS/CMEMS in relation to DHHN2016, but metadata refers to SNN76/Kronstadt (old system). Responsibility of Federal Waterways and Shipping Administration (WSV).	BSH is responsible for water level and current information. BSH coordinates the work.
Latvia	All Paper Charts of Latvia are already implemented to BSCD, LAS-2000,5 since 24.01.2024. All approach and other scale band ENC's are implemented to BSCD2000, LAS-2000,5. Further planned actions are to continue production in BSCD2000, LAS-2000,5. and to implement it into S-100 standard.	All water level stations is connected to LAS-2000,5 (BSCD2000). Data distributed to BOOS/CMEMS in relation to LAS-2000,5. Responsibility of Latvian Environment, Geology and Meteorology Centre (LVGMC).	Meeting between MAL and LVGMC officials has been held about S-104 and S-111. MAL coordinates the work.
Lithuania	National height system LAS-07 (BSCD2000) came into force 2016-01-01. BHS-77 still used. The difference between BHS-77 and LAS-07 is well known (about 13 cm) and is also written in nautical charts.	All water level stations is connected to LAS-07 (BSCD2000). Data distributed to BOOS/CMEMS in relation to BHS-77 (old system). Responsibility of Lithuanian Hydrometeorological Service (LHMS).	Data owner has been identified. LHMS is responsible for water level information and Klaipeda University (KU) for currents. LTSA coordinates the work.
Poland	The implementation of BSCD2000 in PL waters are completed. All charts have been updated to the BSCD2000 (PL-EVRF2007-NH). The last chart (chart No. 500 – general band) was updated in December 2024. All bathymetric data have earlier been transferred to the vertical reference system PL-EVRF2007-NH.	All water level stations is connected to PL-EVRF2007-NH (BSCD2000). Data distributed to BOOS/CMEMS in relation to Amsterdam NN55, but metadata refers to BHS77. The difference between the NN55 and PL-EVRF2007-NH is less than 9 cm. Responsibility of Institute of Meteorology and Water Management (IMGW-PIB).	Agreement with IMGW and Institute of Oceanology of the Polish Academy of Sciences (IOPAN) to provide observed and modelled water level and surface currents data, respectively. HOPN coordinates the work.
Sweden	Ongoing. All decisions are taken. Many charts (ca 50%) already published. Implementation is a part of the "Chart Improvement Project", to be concluded at the latest in 2030. Information compaigns is ongoing for ports, pilots and other interested parties. Notices to Mariners 2019-05-15. Several articles written in magazines and on webpages.	All water level information is presented in relation to RH2000 (BSCD2000), since 2019-06-03. Some applications can also present data in relation to mean sea level (MSL). The differences between MSL and RH2000 is provided in this Table. Data distributed to BOOS/CMEMS in relation to BSCD2000. Responsibility of Swedish Maritime Administration (SMA) and Swedish Meteorological and Hydrological Institute (SMHI).	Discussions started between SMA and SMHI. SMA and SMHI take part in the BS e-Nav-project in cooperation with FMI on this. We will take further actions in 2025. SMA coordinates the work.

Reference levels used in the Baltic Sea and differences with respect to the Baltic Sea Chart Datum 2000 (BSCD2000). In Sweden and Finland, the old reference levels are equal to Mean Sea Level (MSL) transferred to year 2025 (according to different national conventions). The values from Norway shows the MSL over the period 1996-2014, relative NN2000/BSCD2000. In Estonia, Latvia and Lithuania, the Kronstadt datum was previously used as chart datum. In Poland, the local Polish Height System Amsterdam NN_{55} was used as chart datum. Notice how postglacial rebound reduces the magnitude of the MSL in the Bay of Bothnia. The values are shown in this Table.

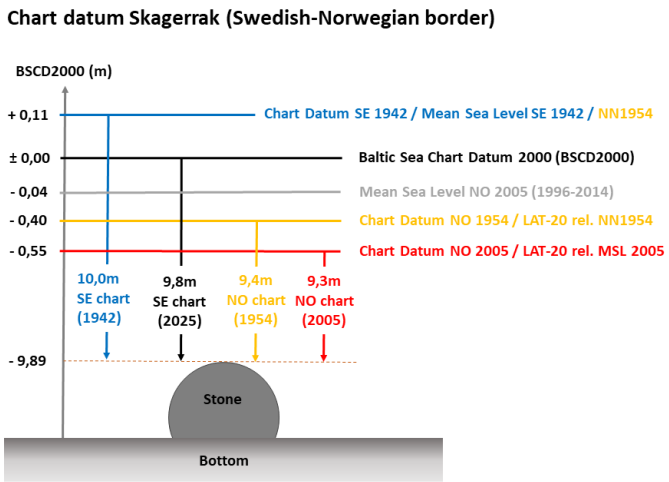
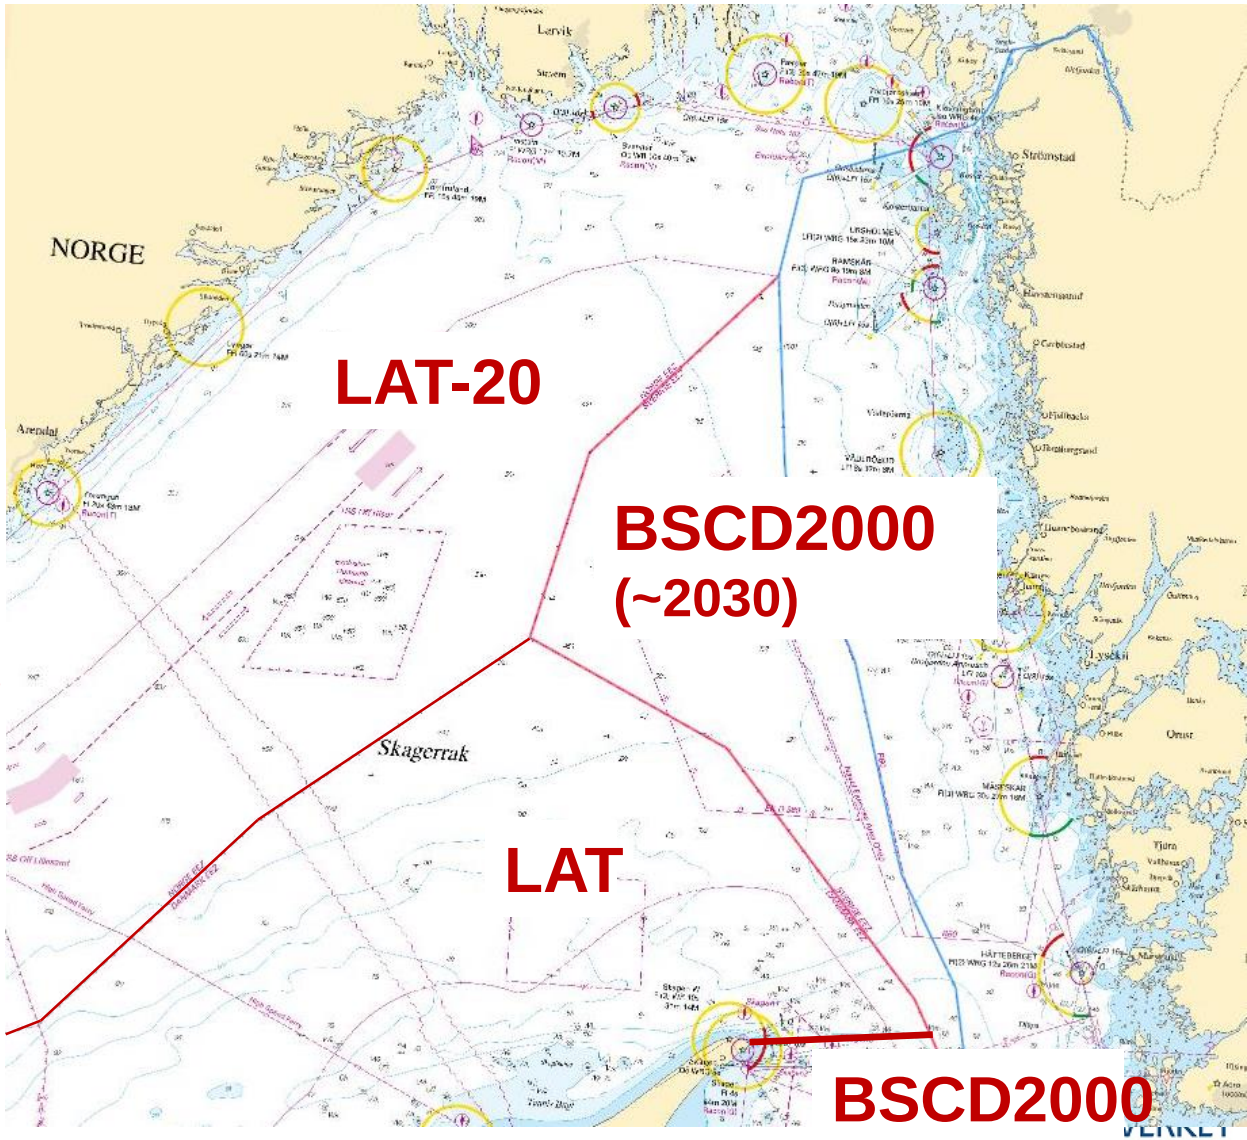
Referensnivåer i Skagerrak

- Norsk referensnivå (LAT-20) ca 50-60 cm under BSCD2000
- Dansk LAT ca 30 cm under BSCD2000





Ny referensnivå i Sverige

Sjöfartsverket och SMHI visar havsvattenstånd i RH2000 sedan 3 juni 2019

SJÖFARTSVERKET

Prognoser och varningar i RH 2000

- SMHI har genomfört en övergång till RH 2000 där prognoser, varningar och aktuellt havsvattenstånd utfärdas i RH 2000.
- Ett nytt konsekvensbaserat och regionalt anpassat varningssystem har införts, som inkluderar gul, orange och röd varning, där röd är den allvarligaste.

Högt vattenstånd			
Varningsnivå	**Gul**	**Orange**	**Röd**
Område	*cm i RH 2000*		
Grupp 1 (Västra Götalands län, Hallands län, Skåne län)	90	130	180
Grupp 2 (Kalmar län, Östergötlands län, Gotlands län, Södermanlands län, Stockholms län)	80	110	-
Grupp 3 (Blekinge län, Uppsala län, Gävleborgs län, Västernorrlands län)	90	130	-
Grupp 4 (Västerbottens län, Norrbottens län)	100	150	-

Lågt vattenstånd	
Varningsnivå	**Gul**
Område	*cm i RH 2000*
Skagerrak, Kattegatt, Södra Östersjön, Mellersta Östersjön, Norra Östersjön, Ålands hav	-80

Södra Bottenhavet, Norra Bottenhavet, Norra Kvarken, Bottenviken	-90

SJÖFARTSVERKET

Underrättelser för sjöfarande (UfS)

*** 14040**

Sverige. Ej områdesbundet. Ny referensnivå för vattenstånd. BSCD2000 / RH 2000.

Notiser som utgår: 2019:754/13917

Se: 2018:716/13140

Från och med den 3 juni 2019 kommer Rikets Höjdsystem 2000, eller RH 2000 (internationell benämning "Baltic Sea Chart Datum 2000", BSCD2000) att utgöra referensnivå för observationer av och prognoser för vattenståndet i svenska farvatten.

Nollnivån i RH 2000 är fast knuten till land och påverkas inte av landhöjning, förändringar i havsnivån eller geografiska variationer.

Förändringen innebär att observationer, prognoser, samt varningar i Sjöfartsverkets-, och SMHIs visningstjänster (t.ex "ViVa" och "Vattenstånd och vågor") från och med 3e juni 2019, eller snarast därefter, refererar till den nya referensnivån och inte längre till medelvattenstånd.

Sjöfartsverket anpassar sjökorten successivt till den nya referensnivån. Detta är en process som pågår under flera år. Under övergångsperioden är det viktigt att ha kännedom om vilken referensnivå som används i den aktuella produkten. Om texten "Baltic Sea Chart Datum 2000", alternativt "BSCD2000" redovisas i det tryckta sjökortet är uppdateringen utförd.

Sveriges nya havsvattenståndsnät

Medfinansierat av Europeiska unionens fond för ett sammanlänkat Europa

- Realtidsdata i RH 2000 från 60 stationer
- 1-minutsvärden med 1 cm noggrannhet
- Realtidskontroll + arkivkontroll

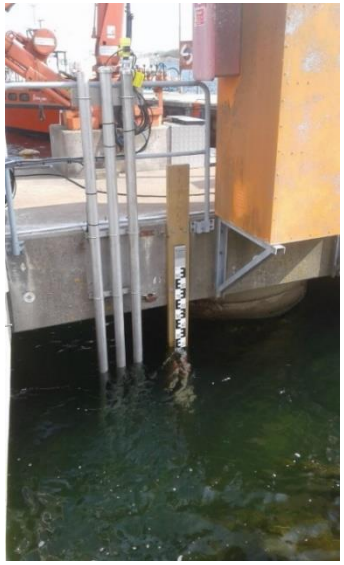
Klass I	Uppgradering med batteribackup	27 stationer (23 SMHI, 3 SJÖV, 1 CTH)
Klass II	Uppgradering utan batteribackup	27 stationer (23 SJÖV, 3 GBG, 1 SKB)
Klass III	Oförändrade, temporära	6 stationer (6 SJÖV)

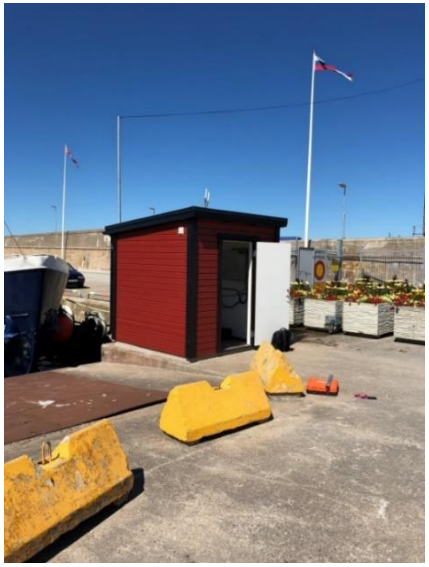
Aktuella vattenstånd visas i Vind- och Vatteninformation (ViVa)

SJÖFARTSVERKET

Uppgradering av svenska vattenståndsnätet 2017-2019

- Ett gemensamt och harmoniserat svenskt stationsnät för havsvattenstånd
- Uppgradering och modernisering av 53 stationer i stationsnätet, två sensorer på varje station
- Vattenståndsdata med bättre noggrannhet, kontinuerliga dataserier
- Öppen och enklare tillgång till kvalitetskontrollerade realtids- och arkivdata
- Alla stationer är anslutna till RH 2000/Baltic Sea Chart Datum 2000
- Delvis finansierat av EU-projektet FAMOS Odin - säkrare och kostnadseffektivare farleder





SJÖFARTSVERKET

Svenska vattenståndsobservationer 1774-2025

- Första observationerna påbörjades i Stockholm 1774
- 141 tidsserier/stationer, 60 stationer är aktiva (2025)
- 5067 års observationer, 4699 års data är digitaliserade (93%)
- 3005 år från aktiva stationer, 100% är digitaliserade
  - Högupplöst data (1-15 minuter)
  - Timvärden
  - Dygnsvärden

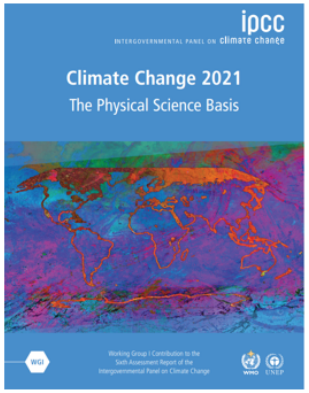
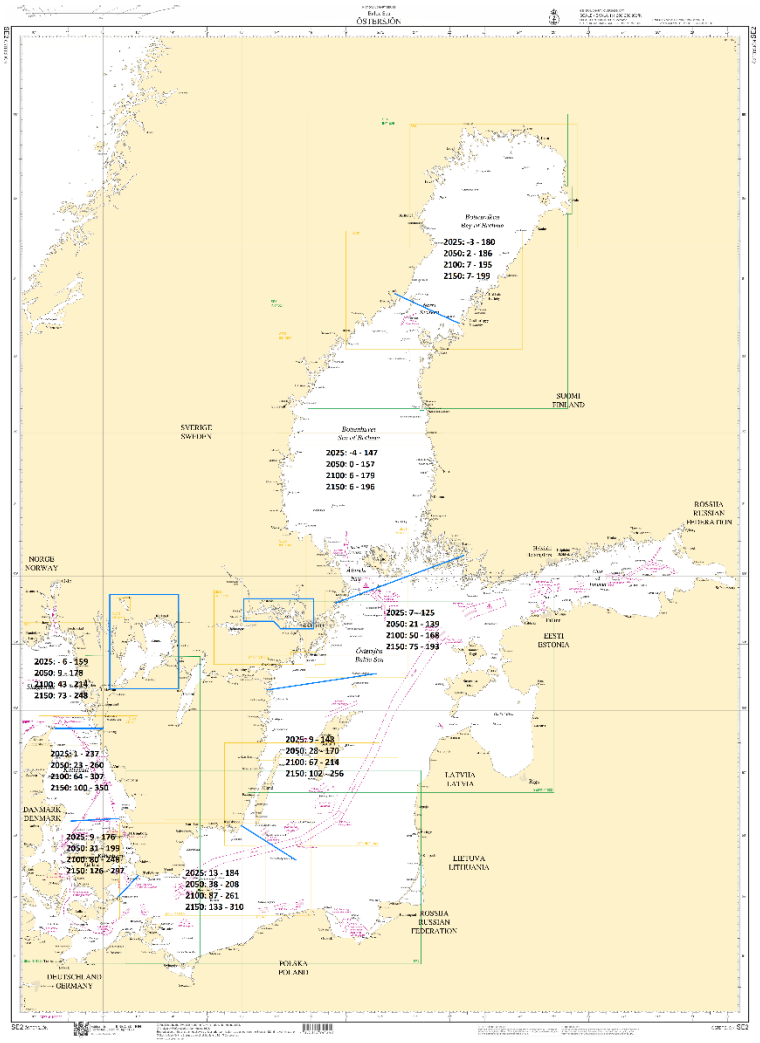
Framtida havsnivåer i Sverige



FN:s klimatpanel (IPCC) släppte 2021 den sjätte utvärderingsrapporten; AR6 Delrapport 1 – Den vetenskapliga grunden [IPCC, 2021: Climate Change 2021: The Physical Science Basis. Contribution of Working Group I to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change] (AR6 WG1), där de presenterar de senaste beräkningarna bl.a. vad gäller framtida havsnivåer. SMHI har sammanställt data för troliga projektioner för åren 2050, 2100 och 2150 kommunvis på sin hemsida (SMHI Framtida medelvattenstånd), vilka har använts i beräkningarna i detta PM.

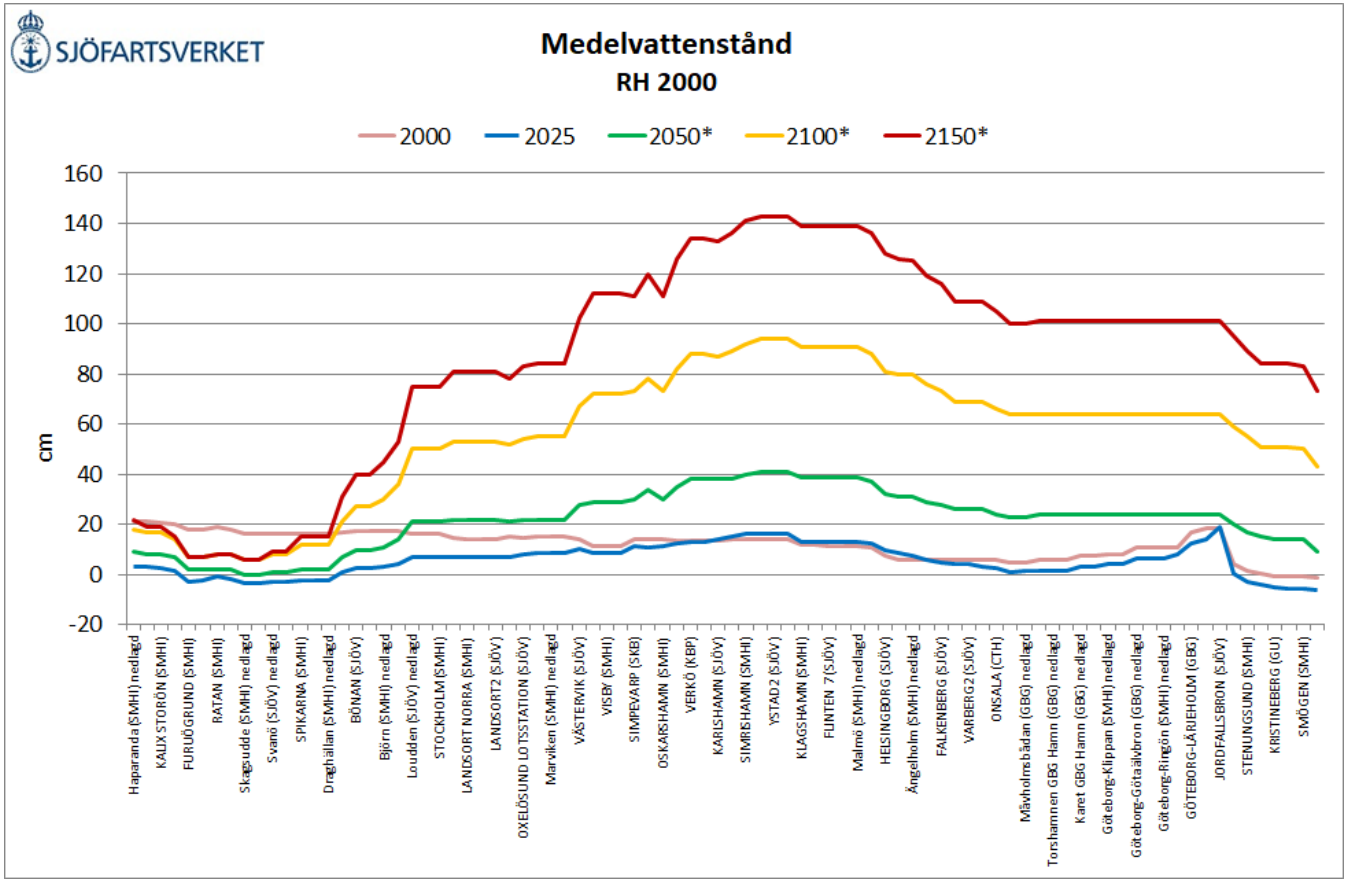
Sammanfattning

Beräkningar av medelvattenstånd och högsta havsvattenstånd för år 2024, 2050, 2100 och 2150 har genomförts för 86 svenska stationer (Figur 5, 6, 7 och Bilaga Tabell 1). Resultaten baseras på analys av historiska observationsdata från år 1886 till och med år 2023 (SMHI Öppna data, Tillgänglighet svenska havsvattenstånd) och extremnivåer beräknade av SMHI (SMHI Extremnivåer), regionala data om den globala havsnivåhöjningen från projektionen SSP5-8.5 (Figur 4, medianvärden, troligt scenario) i FN:s klimatpanels (IPCC) beräkningar presenterade i AR6 Delrapport 1 – Den vetenskapliga grunden (AR6 WG1) och uppgifter om den totala (sammanlagda) landhöjningen sammanställda av SMHI (SMHI Framtida medelvattenstånd), som baseras på Nordiska Kommissionen för Geodesi (NKG) landhöjningsmodell (NKG2016LU). Alla resultat redovisas i Sveriges nationella referenssystem för djup, höjder och vattenstånd; Rikets Höjdsystem 2000 (RH 2000) eller Baltic Sea Chart Datum 2000 (BSCD2000).



SJÖFARTSVERKET

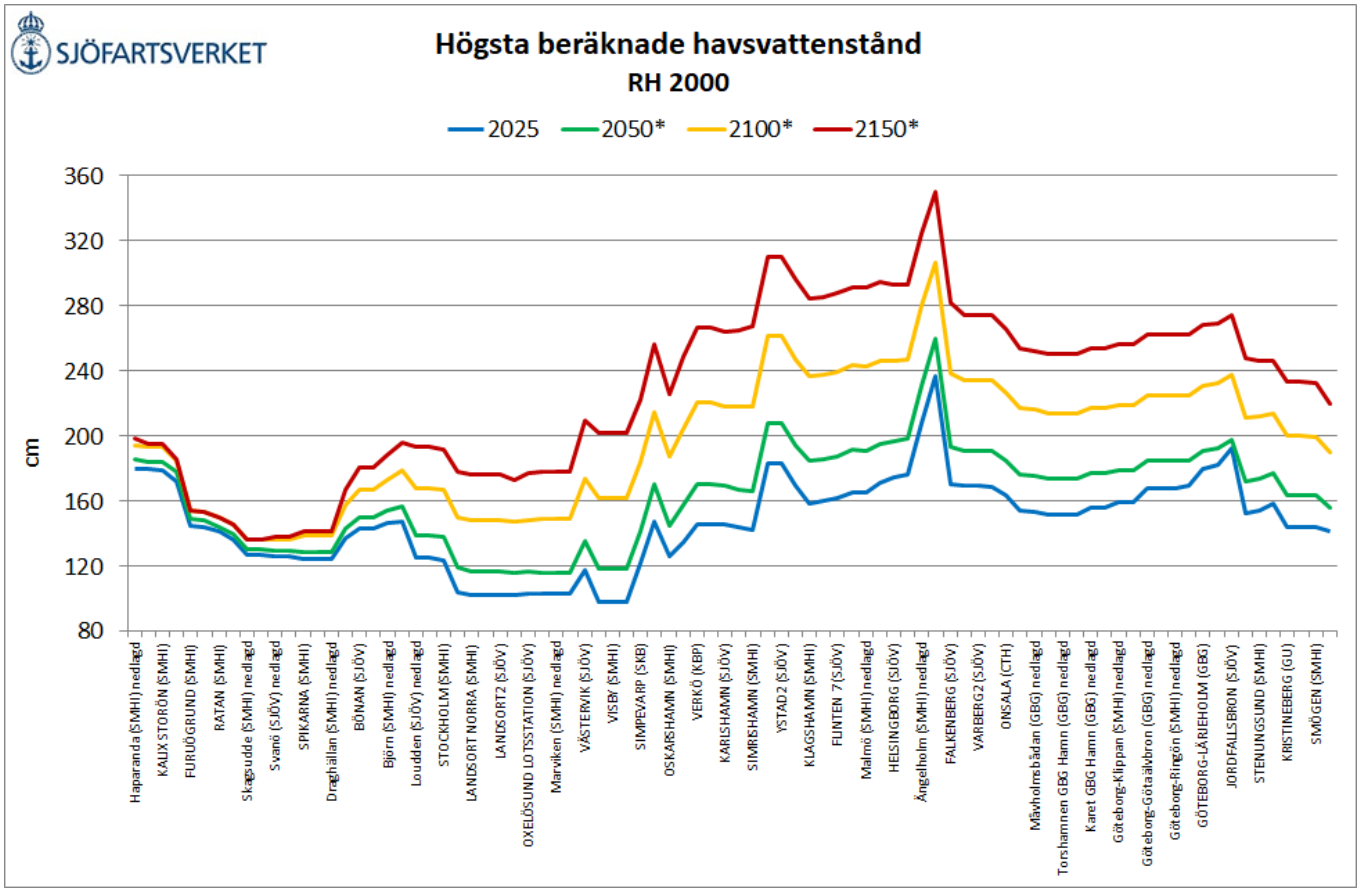
Medelvattenstånd



Beräknade medelvattenstånd i RH 2000 (cm) för år 2000, 2025, 2050*, 2100* och 2150* vid 86 svenska stationer, * inkl. havsnivåhöjning enligt IPCC:s projektion SSP5-8.5 medianvärden (IPCC, AR6 WG1) och total landhöjning (SMHI Framtida medelvattenstånd)

SJÖFARTSVERKET

Högsta havsvattenstånd



Högsta beräknade havsvattenstånd i RH 2000 (cm) för år 2025, 2050*, 2100* och 2150* vid 86 svenska stationer * inkl. havsnivåhöjning enligt IPCC:s projektion SSP5-8.5 medianvärden (AR6) och total landhöjning (SMHI Framtida medelvattenstånd)

Minsta djup i leden efter övergången till RH 2000
Led 202 Flintrännan

Vi har analyserat detaljerad djupdata från DIS i Flintrännan. Det finns två alternativ till redovisning av minsta djup efter övergången till RH 2000:

1. Hela ytans utbredning som den är idag håller 7,9 m i RH 2000.
2. Minsta djup 8 m håller i RH 2000 om ytan smalnas av ca 5 m vid Sjömärke Nr 8.
   Röda punkten ger ungefärlig position på uppgrundningen (7,9xx meter).
   Det finns även en uppgrundning på 7,9xx meter vid Sjömärke Nr 14.
   Här behöver ytan smalnas av ca 1,2 m.

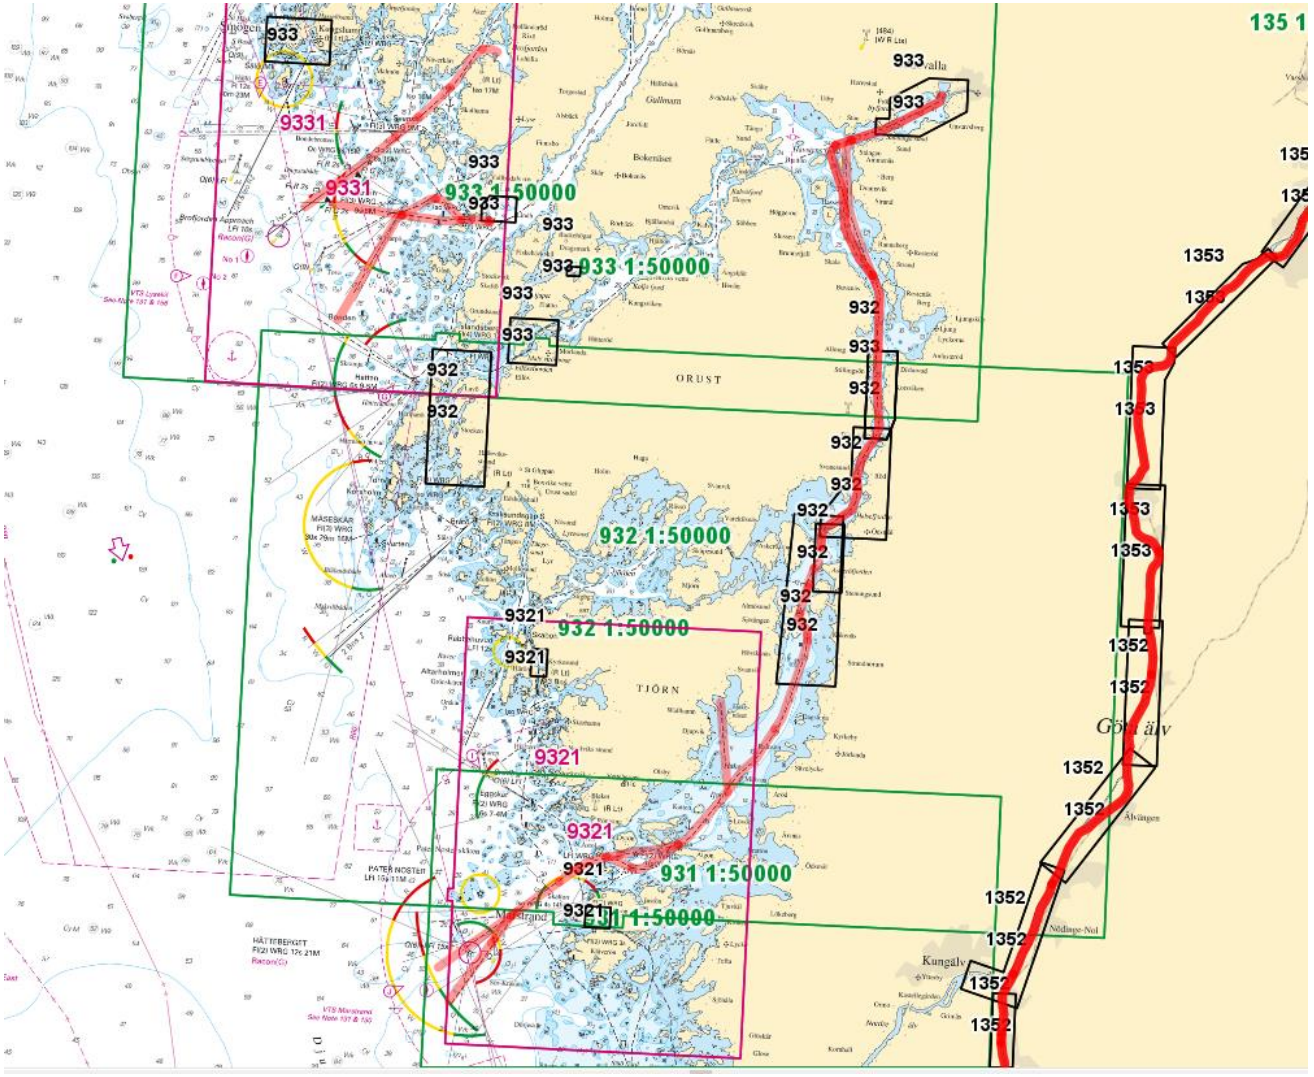
Leden in till Uddevalla berör flera sjökort och deras specialer

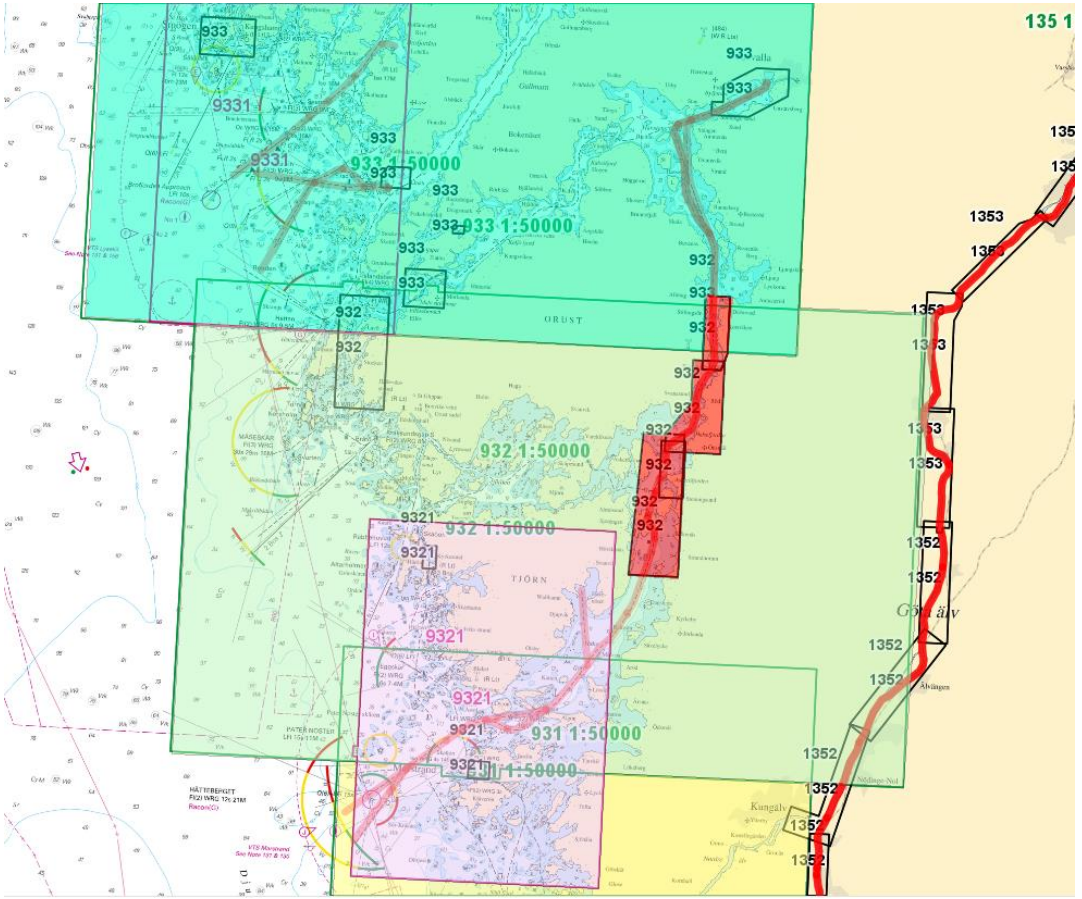
Det är inte samma referens-nivå i dessa utan flera olika



SJÖFARTSVERKET

Led 151-152 Hätteberget-Stenungsund-Uddevalla

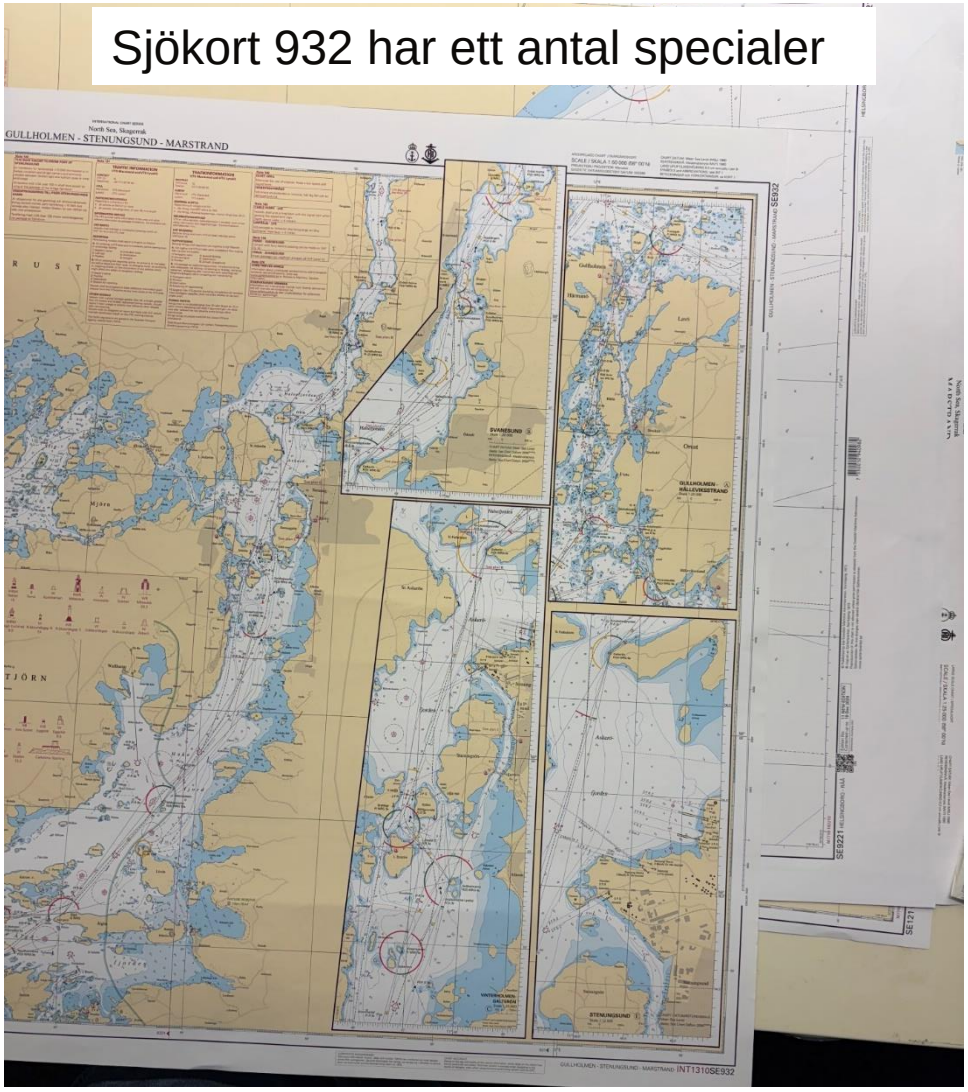
- 932 Special Ref nivå RH2000
- 9321 Ref MVY 1990
- 933 Ref MVY 1958
- 932 Ref MVY 1980
- 931 Ref MVY 1956



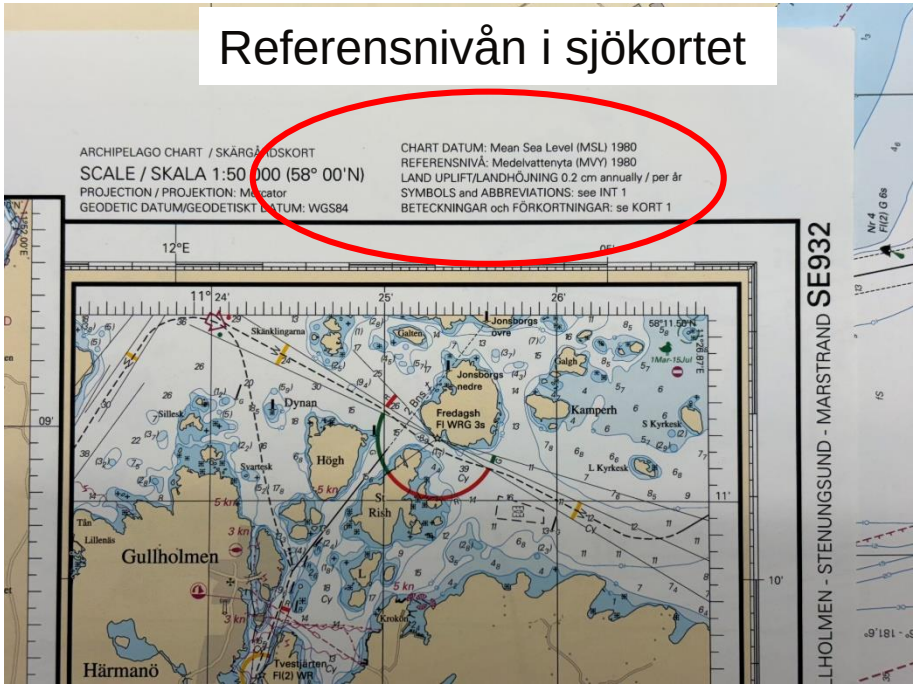
SJÖFARTSVERKET

Referensnivån i sjökort 932

Sjökort 932 har ett antal specialer

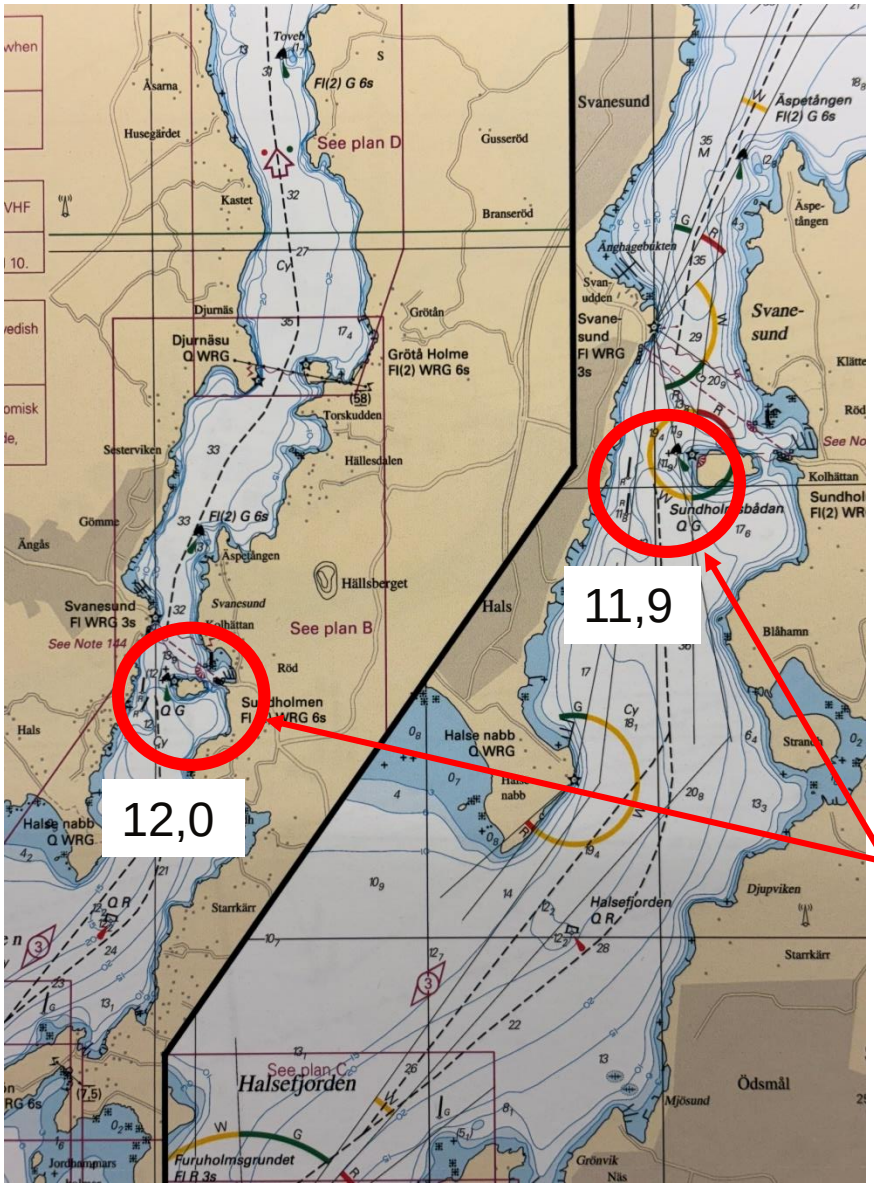


Referensnivån i sjökortet



SJÖFARTSVERKET

Olika djupangivelser beroende på referensnivå



Olika referensnivå i specialen och i övriga sjökortet gör att djupen presenteras med olika värden

SJÖFARTSVERKET
